

Global Cities 2016

Which global cities are performing best today, which have the best long-term potential, and what makes a “smart city”?

Today, more than half of the world's population lives in cities, and the world continues to urbanize rapidly. By 2050, two-thirds of the world's population will live in urban areas, according to the United Nations. As these urban centers swell in size, their influence will only continue to grow.

Recognizing the importance of measuring city-level indicators to track progress, A.T. Kearney's Global Cities has been collecting data on the world's most important cities since 2008 for just this purpose. This, the sixth edition of the Global Cities report, analyzes 125 cities to determine which are the most global. A truly global city, by our definition, is measured by its ability to attract and retain global capital, people, and ideas, as well as sustain that performance in the long term.

Global Cities 2016 comprises two parts:

Global Cities Index: an examination of a city's current performance based on 27 metrics across five dimensions: business activity, human capital, information exchange, cultural experience, and political engagement.

The Index is designed to provide insights into the global reach, performance, and level of development of the world's largest cities. It allows for the comparison of diverse cities—such as New York and Shanghai—to help draw unique conclusions about their shared strengths and core differences.

By 2050, **two-thirds of the world's population** will live in urban areas.

Global Cities Outlook: a projection of a city's potential based on rate of change in 13 indicators across four dimensions: personal well-being, economics, innovation, and governance.

Now in its second edition, the Outlook focuses on bringing a forward-looking perspective to city-level policies and practices that shape future competitiveness. The indicators it covers are designed to measure characteristics of long-term success, such as environmental performance, safety, and innovation capacity.

Together, the Index and Outlook provide a unique look at 125 of the world's largest and most influential cities today and those primed to make an impact in the future. They help to identify the current key players and those cities that might be tomorrow's change makers. Figure 1 on page 2 identifies this year's top 25 cities in both the Index and Outlook. The appendix on page 9 breaks down the Global Cities methodology.

The 15 "Global Elite"

A.T. Kearney's Global Cities identifies a set of cities that rank in the top 25 on both the Index and Outlook—called the "Global Elite." Fifteen cities qualify this year, and they are all well-known hubs of culture and politics, as well as true global economic hubs (see figure 2 on page 3). Combined, they average 8.8 million in population and account for \$7.3 trillion in GDP—or about half of the GDP of all 55 high-income cities measured by Global Cities. Given their combination of strong performance today and high potential, these cities are likely to exert their global influence well into the future.

Leading the Global Elite once again are London and New York City, which remain the only two cities in the top 10 of both the Index and Outlook. Despite the strength of the Global Elite as leaders in the Index and Outlook, they have no lock on global leadership. Eighteen different cities lead among the 27 metrics on the Index, and 20 cities lead or share the lead in the 13 indicators of the Outlook—meaning that even the most “elite” face significant competition from cities in all major regions.

Other cities can use the Index and Outlook to help benchmark city performance. By addressing their strengths and weaknesses, cities can become more competitive on the world stage while helping to redefine what “global” may mean in the future.

A Change at the Top of the Global Cities Index

For the first time since A.T. Kearney’s first Global Cities Index in 2008, London has overtaken New York to claim this year’s top spot. While this finding might surprise some, London’s score has steadily improved since 2008 and reduced New York’s lead (see figure 3 on page 4).

This year, London performed better in two of the five dimensions: cultural exchange and business activity. Even though New York maintained its top position in human capital, London closed the gap. London has also seen noticeable improvement in information exchange, while New York’s political engagement has dropped 10 percent as London’s has increased 33 percent.

The Original 60 Become More Global

Since 2008, A.T. Kearney has continuously sought to improve the usefulness of the Index by including more cities, more than doubling the number of cities measured over the past eight years to include 125 today. But a look at the Index’s original 60 cities from 2008 offers an interesting perspective on how the most global cities in the world are becoming even more

Figure 3

London has steadily closed the gap on New York since the first Index in 2008

Index score

Source: A.T. Kearney Global Cities 2016

global—expanding their reach through increased economic, cultural, and political ties. Since 2008, these 60 cities have registered higher scores, and in four of the five dimensions within the Index (political engagement being the exception), average scores for the original 60 cities have increased. The largest score gains have come in human capital, as these cities improve their attractiveness as global talent hubs through universities, international student populations, and people with tertiary degrees.

San Francisco Leads the Global Cities Outlook

For the second year in a row, San Francisco leads the Outlook, driven largely by its unparalleled strength in innovation.¹ The city's private investments, a proxy for venture capital, more than double that of the next highest grossing city, New York. While San Francisco remains atop the rankings, a few cities have closed the score gap, particularly New York, Boston, and London. New York's score improvements were driven by economics, Boston's by innovation, and London's by governance—highlighting the diversity of strengths that could lead to overall future success.

In this year's Outlook, the personal well-being dimension saw the most improvement. This is perhaps a reflection of the efforts under way by cities around the world to improve quality of life for their citizens, through strategies such as investments into resilient infrastructure to combat climate change or improvements in healthcare access and safety.

Innovation continues to differentiate cities in developed and emerging economies in the Outlook, with North America's and Europe's cities scoring highest in this dimension. As a city's capacity to innovate will continue to define tomorrow's leaders in the new knowledge economy, change in this dimension will be worth watching into the future.

¹ For more on global innovation, see the Global Innovation Index at www.atkearney.com/innovation/global-innovation-index/2015.

Global Cities: “Perfect” and “Fastest”

The top performers on each of the Index’s 27 metrics were used to come up with the “perfect city,” and leaders of each of the 13 indicators of the Outlook were used to construct the “fastest city.”

The result is a mix of cities from across all major world regions and development levels. The “perfect” city requires 18 different cities; the “fastest” requires 20. While the leaders of the five dimensions on the Index (New York, Paris, London, and Washington, D.C.) remain consistent with last year’s results, some new names enter the wider discussion of a perfect city: namely, Geneva and Brussels for access to TV news and Saint Petersburg for sister cities (see figure 4).

The “fastest” city on the Outlook saw the addition of a few new entrants as well. A city with the fastest potential within an indicator means that it has experienced the fastest rate of change over the past five years, which is used to project where the city could stand in 2026 if the current trajectory of growth is continued. For the first time, Melbourne leads a dimension—personal well-being—and new indicator leaders include Karachi, Pakistan for foreign direct investment (FDI) inflows; Sydney and Melbourne for environmental performance; and Brussels

Figure 4

for government transparency (see figure 5).² Karachi is perhaps the biggest surprise of the new entrants; this could be a testament to recent efforts by leadership to promote foreign investment into Pakistan. China and the United Arab Emirates have led recent investment activity into Karachi, which may be beneficial to both as regional business influencers.³

What It Takes to Be “Smart”

Because of its eight-year history, the Global Cities Index is a rich database and can be a powerful tool for analyzing the world’s top-performing cities. As such, each year, A.T. Kearney seeks to identify emerging trends in the data and illuminate current topics of interest. In 2015, the focus was on innovation as the crucial differentiator between developed and emerging economy cities’ performance. This year, the innovation theme was extended to more broadly encompass the idea of smart cities. While there is much discussion around smart cities, with a number of major governments—such as India, the United States, China, and the European Union—shaping initiatives to support the development of smarter cities, there is not yet a standard for what constitutes a “smart” city.

² For more about global FDI, see A.T. Kearney’s Foreign Direct Investment Confidence Index at www.atkearney.com/gbpc/foreign-direct-investment-confidence-index

³ *The Express Tribune*, September 2015

In general terms, most agree that a smart city is one that places technology at the core of its development strategy. The United States recently launched an initiative into smart cities and defined the concept as:

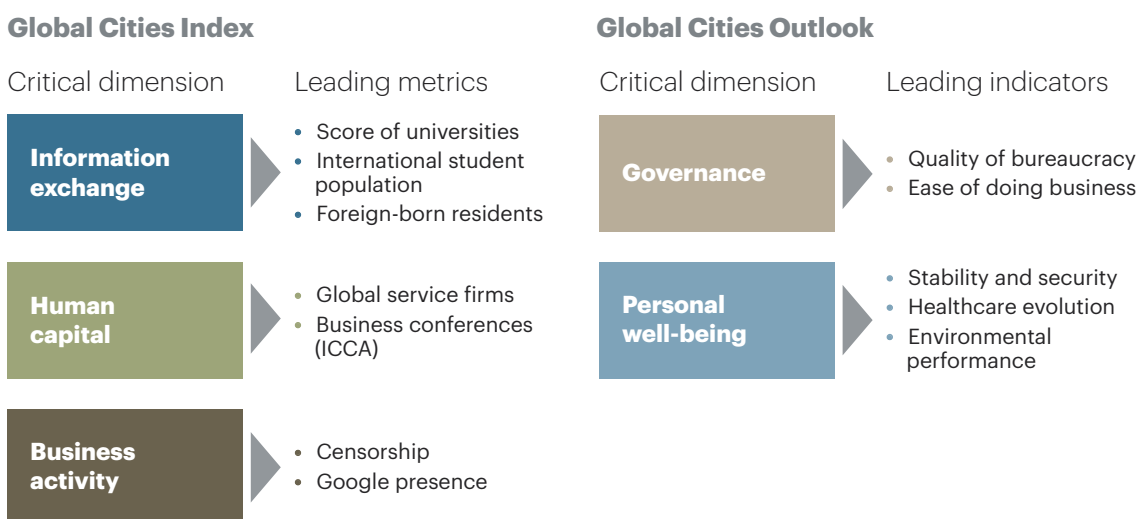

“Communities that are building an infrastructure to continuously improve the collection, aggregation, and use of data to improve the life of their residents—by harnessing the growing data revolution, low-cost sensors, and research collaborations, and doing so securely to protect safety and privacy.”⁴

A.T. Kearney looked at a sample of the world’s recognized leaders in the concept of smart cities—chosen through a literature review—and analyzed their performance in both the Index and Outlook. The goal of the study was to find what traits these cities share in common to answer the question: What makes a city smart?

Of the 14 cities analyzed, all rank in the top quartile of cities measured on both the Index and Outlook. The list included leaders such as New York and London, as well as Amsterdam, Barcelona, Tokyo, Vancouver, Los Angeles, and Melbourne, among others.⁵ Five dimensions—three in the Index and two in the Outlook—seemed to stand out as leading characteristics: information exchange, human capital, business activity, governance, and personal well-being (see figure 6).

Taken together, these traits provide clues as to what critical factors of a city’s performance today will aid in the transformation into a leading smart city of the future. Cities with an engaged network of information-sharing, specialized talent, a vibrant economy, and policies that enable technology adoption and experimentation help to define today’s smart cities and can help others as they seek to adopt smarter policies for the future.

A Look Ahead

A.T. Kearney's Global Cities offers interesting insights into the state of the world, from the point of view of the major population centers that produce so much of the world's commerce and culture. Cities and metro regions are playing an increasingly important role in geopolitics and macroeconomics, with some experts even suggesting that cities are supplanting the traditional nation-state as the world's major economic and political drivers.⁶ As cities see their global influence grow, city performance will inform the strategies of both business leaders—in terms of investment decisions, where to place regional and global headquarters or research centers, and where to recruit—and city government improvement plans.

Taken together, results from this year's Index and Outlook can help cities identify areas of weakness and opportunities for improvement, and it can act as a framework for business leaders looking to inform future growth strategies. This year's results point to a future that is anything but certain, as rank fluctuations show the level of competition and volatility in today's operating environment. We look forward to seeing what next year's results might tell us about the changes upon us in the global system.

Appendix

Global Cities methodology

Global Cities Index—current performance

- Measures 27 metrics across five dimensions
 - Business activity (30%):** capital flow, market dynamics, and major companies present
 - Human capital (30%):** education levels
 - Information exchange (15%):** access to information through Internet and other media sources
 - Cultural experience (15%):** access to major sporting events, museums, and other expos
 - Political engagement (10%):** political events, think tanks, and embassies
- Rank and score** are determined by totaling the weighted averages of each dimension to yield a score on a scale of 0 to 100 (100=perfect)
- Sources** are derived from publicly available city-level data¹

Global Cities Outlook—future potential

- Measures 13 indicators across four dimensions
 - Personal well-being (25%):** safety, healthcare, inequality, and environmental performance
 - Economics (25%):** long-term investments and GDP
 - Innovation (25%):** entrepreneurship through patents, private investments, and incubators
 - Governance (25%):** proxy for long-term stability through transparency, quality of bureaucracy, and ease of doing business
- Rank and score** determined by averaging rate of change across each metric using the past five years' data, then projecting out to 2026. Weighted averages applied to each dimension to yield a score on a scale of 0 to 100 (100=perfect)
- Sources** are derived from publicly available city-level data¹

¹In the few cases when city-level data is not available, country-level data is used.

Smart cities methodology

14 cities were reviewed across all metrics of the Index and Outlook

City	Index rank	Outlook rank
Barcelona	26	34
Brussels	12	22
Copenhagen	42	24
London	1	4
Los Angeles	6	21
Melbourne	15	15
New York	2	2
Paris	3	13
Singapore	8	17
Sydney	14	12
Tokyo	4	19
Toronto	17	18
Vancouver	37	25
Vienna	19	41

Methodology

- Looked for **metrics where cities outranked** the average
- Any dimension where nine or more cities ranked in the top quartile of cities was considered a **critical dimension for being “smart”**
- Within the critical dimensions, any metric where nine or more cities ranked in the top quartile was considered a **leading metric for being “smart”**

*Smart Cities we identified were ranked as “smart” based on multiple sources. All smart cities ranked in the top one-third of cities on both the Index and Outlook.
